Table of Contents

1. Indices
2. Grouping
3. Aggregate Functions
4. Having Clause

Indices

Clustered and Non-Clustered Indexes
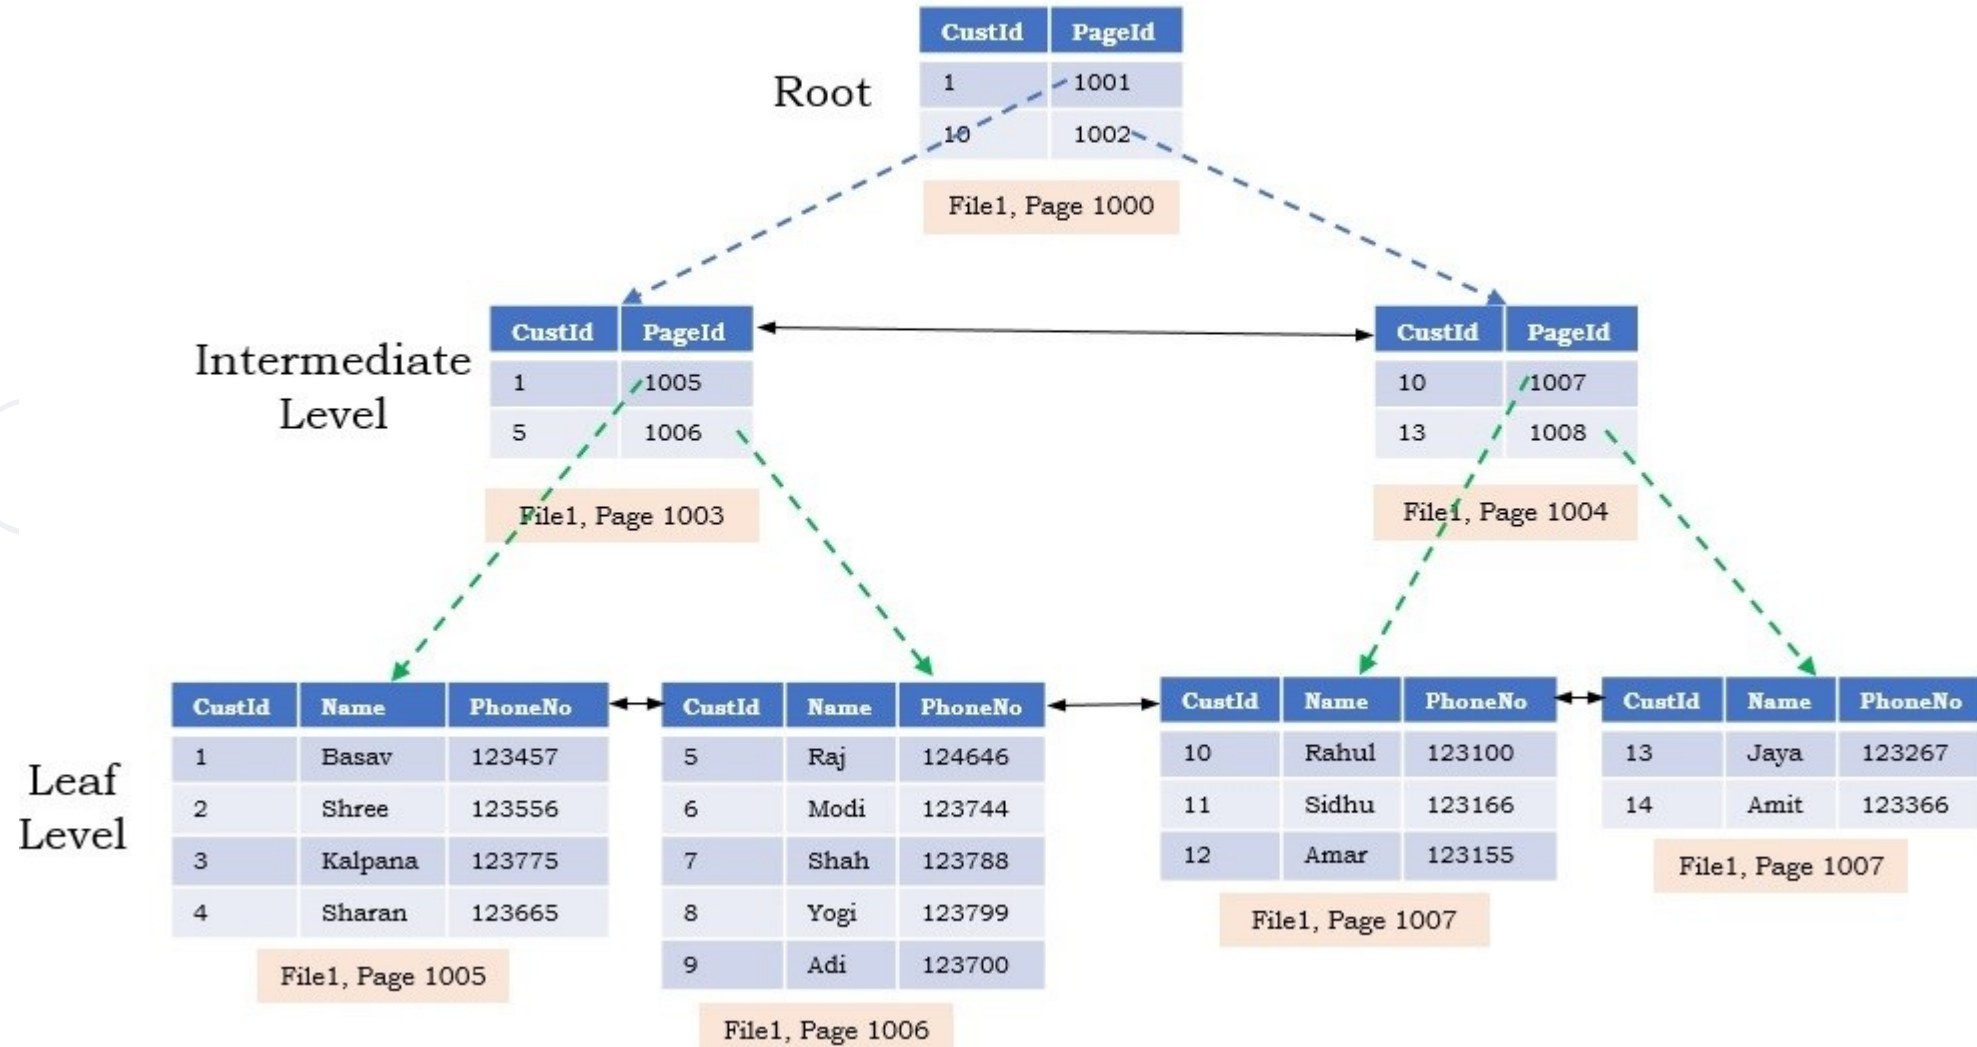

Indices

- **Indices speed up the searching of values** in a certain column or group of columns

  - Usually implemented as **B-trees**

- Indices can be **built-in the table** (**clustered**) or **stored externally** (**non-clustered**)

- **Adding** and **deleting** records in indexed tables is **slower**!

  - Indices should be used **for big tables only** (e.g. 500 000 rows).

Clustered Indexes

- **Clustered index** is actually **the data itself**

  - Very useful for **fast execution** of **WHERE**, **ORDER BY** and **GROUP BY** clauses.

- Maximum **1** clustered index **per table**

  - If a table **has no clustered index**, its **data rows are stored in** an unordered structure (**heap**).
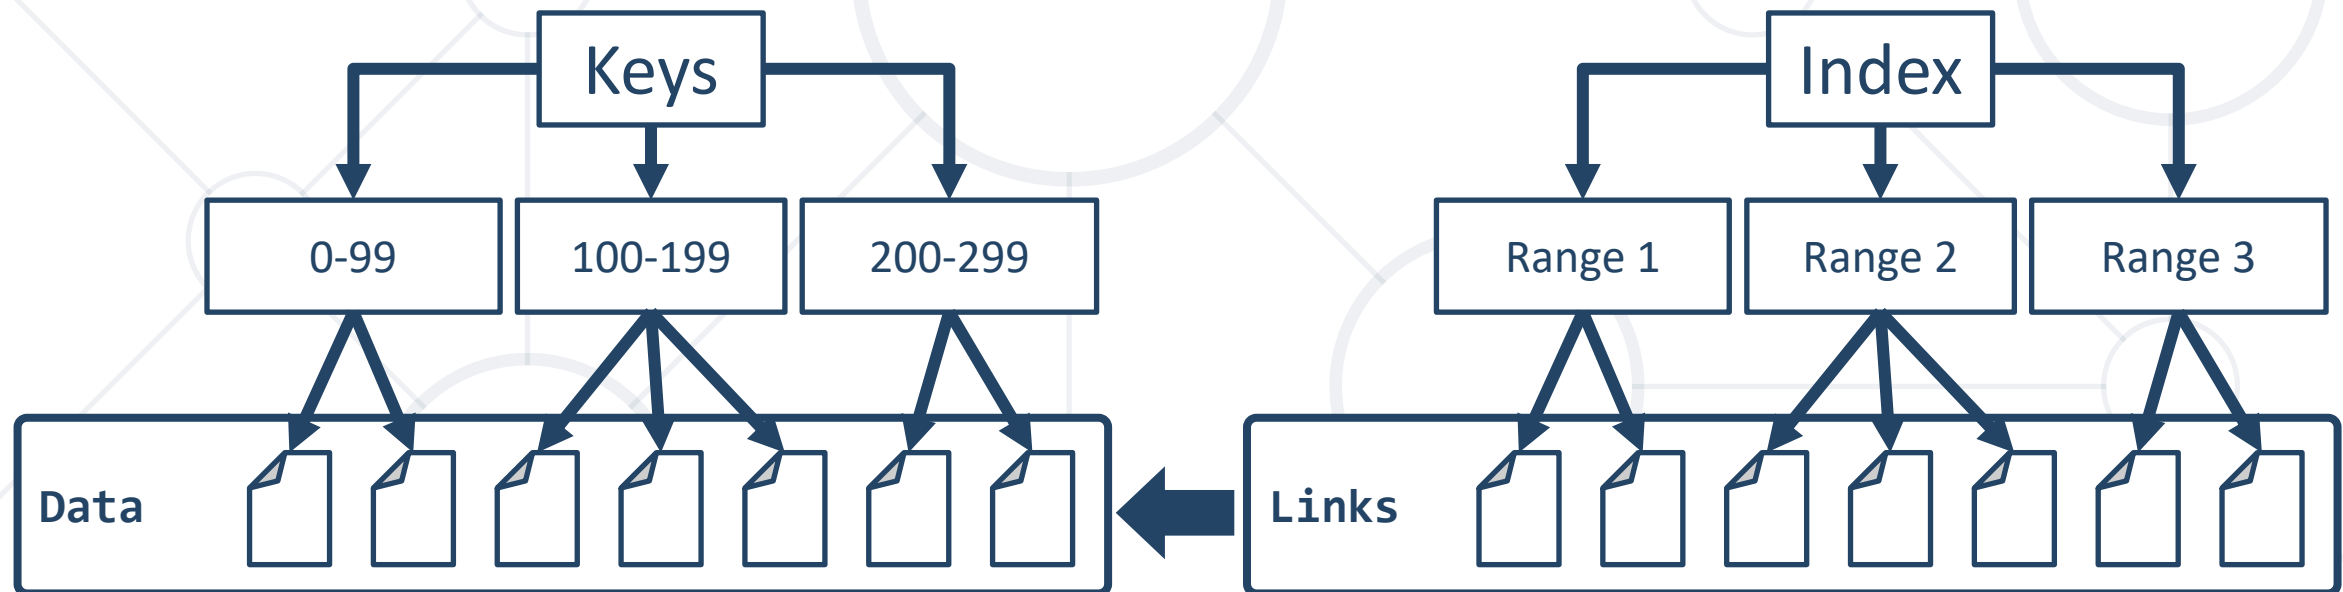

Clustered Indexes (2)

B+ Tree Structure of a Clustered Index

Root

CustId	PageId
1	1001
10	1002

File1, Page 1000

Intermediate Level

CustId	PageId
1	1005
5	1006

File1, Page 1003

CustId	PageId
10	1007
13	1008

File1, Page 1004

Leaf Level

CustId	Name	PhoneNo
1	Basav	123457
2	Shree	123556
3	Kalpana	123775
4	Sharan	123665

File1, Page 1005

CustId	Name	PhoneNo
5	Raj	124646
6	Modi	123744
7	Shah	123788
8	Yogi	123799
9	Adi	123700

File1, Page 1006

CustId	Name	PhoneNo
10	Rahul	123100
11	Sidhu	123166
12	Amar	123155

File1, Page 1007

CustId	Name	PhoneNo
13	Jaya	123267
14	Amit	123366

File1, Page 1007

Non-Clustered Indexes

- Useful for **fast retrieving of** a range of records

- Maintained in a **separate structure** in the DB

- Tend to be **much narrower** than the base table

  - Can **locate the exact record(s)** with **less I/O**

- Has **at least one more intermediate level** than the clustered index

  - Much **less valuable** if a table **doesn't have a clustered index**

- A non-clustered index **has pointers** to the **actual data rows** (pointers to the clustered index if there is one).

Indices Syntax

Index Type

```
CREATE NONCLUSTERED INDEX
IX_Employees_FirstName_LastName
ON Employees(FirstName, LastName)
```

Table Name

Columns

Consolidating Data Based On Criteria

Grouping (1)

- **Grouping** allows receiving data into separate groups based on a common property

Grouping column

Single row

Can be aggregated

Employee	DepartmentName	Salary
Adam	**Database Support**	5,000
John	**Database Support**	15,000
Jane	**Application Support**	10,000
George	**Application Support**	15,000
Lila	**Application Support**	5,000
Fred	**Software Support**	15,000

Grouping (2)

- **GROUP BY** allows you to get each **separate group** and use an "**aggregate**" function over it (like **Average**, **Min** or **Max**):

```
SELECT e.DepartmentID
   FROM Employees AS e
GROUP BY e.DepartmentID
```

Group Columns

- **DISTINCT** allows you to get **all unique** values:

```
SELECT DISTINCT e.DepartmentID
   FROM Employees AS e
```

Unique Values

13

- Use "**SoftUni**" **database** to create a query which prints the total sum of salaries for each department.

  - Order them by DepartmentID (ascending).

Employee	DepartmentID	Salary
Adam	1	5,000
John	1	15,000
Jane	2	10,000
George	2	15,000
Lila	2	5,000
Fred	3	15,000

DepartmentID	TotalSalary
1	20,000
2	30,000
3	15,000

Solution: Departments Total Salaries

- After **grouping** every employee **by** it's **department** we can use an **aggregate function** to calculate the total amount of money per group.

```
SELECT e.DepartmentID,
    SUM(e.Salary) AS TotalSalary
FROM Employees AS e
GROUP BY e.DepartmentID
ORDER BY e.DepartmentID
```

Column Alias

Table Alias

Group Columns

Aggregate Functions

COUNT, SUM, MAX, MIN, AVG…

Aggregate Functions

- Operate over (**non-empty**) **groups**

- Perform **data analysis** on each one

  - **MIN**, **MAX**, **AVG**, **COUNT**, etc.

```
SELECT e.DepartmentID,
 MIN(e.Salary) AS MinSalary
FROM Employees AS e
GROUP BY e.DepartmentID
```

	DepartmentID	MinSalary
1	1	32700.00
2	2	25000.00
3	3	23100.00
4	4	13500.00
5	5	12800.00
6	6	40900.00

- Aggregate functions usually **ignore NULL** values

Aggregate Functions: COUNT

- **COUNT** - **counts the values** in one or more **grouped columns**
  - **Ignores NULL** values

Employee	DepartmentName	Salary
Adam	Database Support	5,000
John	Database Support	15,000
Jane	Application Support	10,000
George	Application Support	15,000
Lila	Application Support	5,000
Fred	Software Support	15,000

DepartmentName	SalaryCount
Database Support	2
Application Support	3
Software Support	1

COUNT Syntax

- **COUNT**(**ColumnName**)

```
SELECT e.DepartmentID,
       COUNT(e.Salary) AS SalaryCount
  FROM Employees AS e
GROUP BY e.DepartmentID
```

New Column Alias

Group Columns

- Note: **COUNT ignores** any employee with **NULL** salary.

Aggregate Functions: SUM

- **SUM** - **sums the values** in a column.

Employee	DepartmentName	Salary
Adam	Database Support	5,000
John	Database Support	15,000
Jane	Application Support	10,000
George	Application Support	15,000
Lila	Application Support	5,000
Fred	Software Support	15,000

DepartmentName	TotalSalary
Database Support	20,000
Application Support	30,000
Software Support	15,000

SUM Syntax

- If any department **has no salaries**, it **returns NULL**.

Grouping Column

New Column Alias

```
SELECT e.DepartmentID,
       SUM(e.Salary) AS TotalSalary
  FROM Employees AS e
GROUP BY e.DepartmentID
```

Aggregate Functions: MAX

- **MAX** - takes **the largest value** in a column.

Employee	DepartmentName	Salary
Adam	Database Support	5,000
John	Database Support	15,000
Jane	Application Support	10,000
George	Application Support	15,000
Lila	Application Support	5,000
Fred	Software Support	15,000

DepartmentName	MaxSalary
Database Support	15,000
Application Support	15,000
Software Support	15,000

MAX Syntax

Grouping Column

New Column Alias

```
SELECT e.DepartmentID,
       MAX(e.Salary) AS MaxSalary
  FROM Employees AS e
GROUP BY e.DepartmentID
```

Group Columns

Aggregate Functions: MIN

- **MIN** - takes **the smallest value** in a column.

Employee	DepartmentName	Salary
Adam	Database Support	5,000
John	Database Support	15,000
Jane	Application Support	10,000
George	Application Support	15,000
Lila	Application Support	5,000
Fred	Software Support	15,000

DepartmentName	MinSalary
Database Support	5,000
Application Support	5,000
Software Support	15,000

```
SELECT e.DepartmentID,
       MIN(e.Salary) AS MinSalary
  FROM Employees AS e
GROUP BY e.DepartmentID
```

New Column Alias

Group Columns

Aggregate Functions: AVG

- **AVG** - calculates the **average value** in a column.

Employee	DepartmentName	Salary
Adam	Database Support	5,000
John	Database Support	15,000
Jane	Application Support	10,000
George	Application Support	15,000
Lila	Application Support	5,000
Fred	Software Support	15,000

DepartmentName	AvgSalary
Database Support	10,000
Application Support	10,000
Software Support	15,000

```
SELECT e.DepartmentID,
       AVG(e.Salary) AS AvgSalary
  FROM Employees AS e
GROUP BY e.DepartmentID
```

New Column Alias

Group Columns

Aggregate Functions: STRING_AGG

- **STRING_AGG** - Concatenates the values of string expressions and places separator values between them. The separator is not added at the end of string

> Expressions are converted to **NVARCHAR** or **VARCHAR** types during concatenation. Non-string types are converted to **NVARCHAR** type

```
STRING_AGG ( expression, separator )
   [WITHIN GROUP ( ORDER BY expression [ ASC | DESC ] )]
```

Having

Using Predicates While Grouping

Having Clause

- The **HAVING clause** is used to **filter data** based on **aggregate values**
  - We **cannot** use it **without grouping** first
- **Aggregate functions** (MIN, MAX, SUM etc.) are **executed only once**
  - Unlike HAVING, **WHERE filters** rows **before aggregation**

HAVING Clause: Example

- Filter departments having total salary more than or equal to 15,000

Aggregated value

Employee	DepartmentName	Salary	TotalSalary
Adam	Database Support	5,000	20,000
John	Database Support	15,000	
Jane	Application Support	1,000	
George	Application Support	5,000	11,000
Lila	Application Support	5,000	
Fred	Software Support	15,000	15,000

DepartmentName	TotalSalary
Database Support	20,000
Software Support	15,000

HAVING Syntax

```
SELECT e.DepartmentID,
       SUM(e.Salary) AS TotalSalary
  FROM Employees AS e
GROUP BY e.DepartmentID
 HAVING SUM(e.Salary) >= 15000
```

Aggregate Function

Column Alias

Grouping Columns
Having Predicate

Summary

1. Grouping by Shared Properties
2. Aggregate Functions
3. Having Clause

```
SELECT
    SUM(e.Salary) AS 'TotalSalary'
FROM Employees AS e
GROUP BY e.DepartmentID
HAVING SUM(e.Salary) >= 15_000
```
